< ロ > < 同 > < 三 > < 三 > 、 三 の Q (?)

Preliminaries

A certain asymmetry

Grammar vs logic

- *"It is true that A"* corresponds to *True(A)*.
- "It is false that A" corresponds to True(¬A)
 as opposed to False(A).

The Frege Point:

We clearly need *assertion* and *negation* as primitives, thus primitive *rejection* is redundant.

The term is coined in Peter Geach (1965) Assertion.

Who takes rejection seriously

Timothy Smiley (1996) Rejection.

Assertion and rejection as primitive notions.

Meta-linguistic notation *A for "A is rejected" (not a connective).

Formula A by itself is read as "A is asserted".

A kind of natural deduction for classical logic.

Motivates bilateralism, see Ian Rumfitt (2000) 'Yes' and 'no'

A typical example

Nelson's logic N4 with *strong (constructible)* negation ~.
D. Nelson (1949) *Constructible falsity*A. Almukdad, D. Nelson (1984) *Constructible falsity and inexact predicates*

How does it take rejection seriously

- i) relational semantics with two forcing relations;
- ii) twist-structure algebraic semantics;
- iii) some two-sorted sequent and display calculi;

iv) $\vdash_{\mathsf{N4}} A \leftrightarrow B$ is not a congruence but $\vdash_{\mathsf{N4}} (A \leftrightarrow B) \land (\sim A \leftrightarrow \sim B)$ is.

2-Intuitionistic logic

Bi-intuitionistic logic

Bi-intuitionistic logic Bilnt — a conservetive extension of Int with *co-implication* —.

C. Rauszer (1974) Semi-boolean algebras and their applications to intuitionistic logic with dual operations

Although **Bilnt** is very natural semantically, proof theory is a problem:

- Most sequent calculi are either very non-standard or don't have cut elimination.
- There is no natural deduction system for Bilnt (there is a non-standard one by Luca Tracnhini).
- Most natural proof theoretic framework for Bilnt seems to be display calculi.

2Int — a variant of bi-intuitionistic logic motivated by providing a natural deduction system for bi-intuitionistic connectives.

H. Wansing (2013) *Falsification, natural deduction* and bi-intuitionistic logic

The idea is to add rejection conditions for every connective as duals of assertion conditions for their duals.

Assertion/rejection of $\land, \lor, \rightarrow, \top, \bot$ can be treated as in N4.

・ロト・西ト・ヨト・ヨト・日下 ひゃつ

Natural deduction for 2Int

From proofs to refutations via dualization

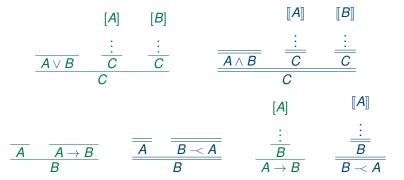

Dualize all rules of intuitionistic natural deduction

		$\frac{\bot}{A}$	$\overline{\frac{\top}{A}}$
$\frac{\boxed{A}}{A \wedge B}$		$\frac{\hline A}{A \lor B}$	
$A \wedge B$ A	$\frac{\overline{A \lor B}}{A}$	$A \wedge B$ B	A∨B B
$\frac{\overline{A}}{A \lor B}$	$\frac{\overline{A}}{\overline{A \land B}}$	$\frac{B}{A \lor B}$	\overline{B} $\overline{A \wedge B}$

 $\overline{A} \mapsto \overline{\overline{A}}$.

Natural deduction for 2Int

[*A*] is a discharged assumption about assertion,[*A*] is a discharged assumption about rejection.

Natural deduction for 2Int

Q: how do we refute implicative formulas?

A: like in Nelson's logics.

$$\frac{\boxed{A} \quad \boxed{B}}{A \to B} \qquad \frac{\boxed{A \to B}}{A} \qquad \frac{\boxed{A \to B}}{B}$$

Q: how do we assert co-implicative formulas? *A:* dualize.

$$\frac{\overline{A} \quad \overline{B}}{A \prec B} \qquad \frac{\overline{A \prec B}}{A} \qquad \frac{\overline{A \prec B}}{B}$$

< □ > < □ > < 三 > < 三 > < 三 > < 三 > < ○ < ○

Two consequence relations of 2Int

Assertion-based consequence $\Gamma : \Delta \vdash_{N2Int}^{+} A$:

Intuitively: "if all formulas in Γ are proved and all formulas in Δ are refuted, then A is proved".

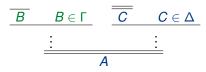

Two consequence relations of 2Int

Assertion-based consequence $\Gamma : \Delta \vdash_{\mathsf{N2Int}}^{+} A$:

Intuitively: "if all formulas in Γ are proved and all formulas in Δ are refuted, then A is proved".

Rejection-based consequence $\Gamma : \Delta \vdash_{N2Int}^{-} A$:

Intuitively: "if all formulas in Γ are proved and all formulas in Δ are refuted, then A is refuted".

・ロト・(四ト・(ヨト・(日)) (日)

Semantics for 2Int

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

2Int-models

A 2Int-frame is a partially ordered set $\mathcal{W} = \langle W, \leq \rangle$.

A 2Int-model $\mu = \langle W, v^+, v^- \rangle$ is a 2Int-frame together with two valutations satisfying *intuitionistic heredity*:

$$x \in v^{\delta}(p) \text{ and } x \leq y \text{ implies } y \in v^{\delta}(p), \quad \delta \in \{+,-\}.$$

Remark: these models are exactly the same as N4-models, except...

Two forcing relations

For a 2Int-model $\mu = \langle W, \leq, v^+, v^- \rangle$ and $x \in W$ put

$$\mu, x \models^+ A \to B \iff \forall y \ge x \ (\mu, y \models^+ A \Rightarrow \mu, y \models^+ B);$$

$$\mu, x \models^- A \to B \iff \mu, x \models^+ A \text{ and } \mu, x \models^- B;$$

$$\mu, x \models^+ A \prec B \iff \mu, x \models^+ A \text{ and } \mu, x \models^- B;$$

$$\mu, x \models^- A \prec B \iff \forall y \ge x \ (\mu, y \models^- B \Rightarrow \mu, y \models^- A);$$

For a set of formulas, Γ , put:

$$\mu, x \models^+ \Gamma \iff \mu, x \models^+ A \text{ for all } A \in \Gamma;$$

$$\mu, x \models^- \Gamma \iff \mu, x \models^- A \text{ for all } A \in \Gamma;$$

Two negations

We can define *intuitionistic negation* $\neg A := A \rightarrow \bot$

$$\mu, x \models^+ \neg A \iff \forall y \ge x : \ \mu, y \nvDash^+ A;$$
$$\mu, x \models^- \neg A \iff \mu, x \models^+ A;$$

and *dual intuitionistic negation* $\neg A := \top \prec A$

$$\mu, x \models^{+} \neg A \iff \mu, x \models^{-} A;$$

$$\mu, x \models^{-} \neg A \iff \forall y \ge x : \mu, x \nvDash^{-} A.$$

Observe that

- i) dual negation acts as a switch from assertion to rejection;
- ii) negation \neg acts as a switch from rejection to assertion.

Semantics for 2Int

Two semantic consequence relations

$$\begin{split} & \Gamma : \Delta \vDash_{\mathsf{N2Int}}^{+} A \text{ if for any 2Int-model } \mu = \langle W, \leq, v^+, v^- \rangle \\ & \forall x \in W \ (\mu, x \vDash^+ \Gamma \text{ and } \mu, x \vDash^- \Delta \implies \mu, x \vDash^+ A). \\ & \Gamma : \Delta \vDash_{\mathsf{N2Int}}^{-} A \text{ if for any 2Int-model } \mu = \langle W, \leq, v^+, v^- \rangle: \\ & \forall x \in W \ (\mu, x \vDash^- \Gamma \text{ and } \mu, x \vDash^- \Delta \implies \mu, x \vDash^- A). \end{split}$$

Completeness [Wansing2013]

$$\begin{array}{l} \Gamma: \Delta \vdash_{\mathsf{N2Int}}^{+} A \Longleftrightarrow \ \Gamma: \Delta \vDash_{\mathsf{N2Int}}^{+} A; \\ \Gamma: \Delta \vdash_{\overline{\mathsf{N2Int}}}^{-} A \Longleftrightarrow \ \Gamma: \Delta \vDash_{\overline{\mathsf{N2Int}}}^{-} A. \end{array}$$

< ロ > < 目 > < 三 > < 三 > < 三 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Replacement for 2Int

Remark: 2Int shares N4's problems with replacement.

Weak replacement for 2Int:

$$\overline{A \leftrightarrow B} \quad \overline{\neg A \leftrightarrow \neg B} \ \overline{C[A] \leftrightarrow C[B]}$$
,

Positive replacement for 2Int:

$$\overline{[A\leftrightarrow B]}$$
, where C is \sim -free. \cdot

< □ > < □ > < 三 > < 三 > < 三 > < 三 > < ○ < ○

Replacement for 2Int

Put
$$A > B := (A - B) \lor (B - A)$$
.

Dual weak replacement for 2Int:

$$\frac{\overline{A \rightarrow A}}{C[A] \rightarrow C[B]},$$

Dual positive replacement for 2Int:

$$\frac{\overline{A \rightarrowtail B}}{\overline{C[A] \rightarrowtail C[B]}}$$
, where C is \rightarrow -free.

< □ > < □ > < 三 > < 三 > < 三 > < 三 > < ○ < ○

Change of perspective

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Internalizing attitudes

A signed formula is just A^+ , A^- , where A is a formula.

A⁺ corresponds to "A is asserted".

A⁻ corresponds to "A is rejected".

Use \overline{A} , \overline{B} , \overline{C} for signed formulas; Use $\overline{\Gamma}$, $\overline{\Delta}$ for sets of signed formulas.

A simple correspondence

For a set of formulas, Γ, put

$$\Gamma^+ = \{ \boldsymbol{A}^+ \mid \boldsymbol{A} \in \Gamma \} \qquad \Gamma^- = \{ \boldsymbol{A}^- \mid \boldsymbol{A} \in \Gamma \}.$$

For a set of signed formulas, $\overline{\Gamma}$, put

$$\bar{\Gamma}_+ := \{ A \mid A^+ \in \bar{\Gamma} \} \qquad \bar{\Gamma}_- := \{ A \mid A^- \in \bar{\Gamma} \}.$$

From pairs of sets of formulas to sets of signed formulas:

$$\Gamma: \Delta \mapsto \Gamma^+ \cup \Delta^-.$$

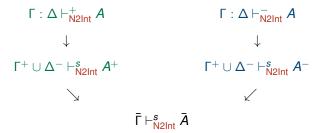

From sets of signed formulas to pairs of sets of formulas:

$$\overline{\Gamma} \mapsto \overline{\Gamma}_+ : \overline{\Gamma}_-.$$

Rewriting consequence relations of 2Int

Step 1: identify antecedent with a set of signed formulas;

Step 2: shift the sign from turnstile onto formula in the consequent.

Result: a single consequence relation on signed formulas.

Remark: can do the same with semantic consequence.

Some familiar looking properties

 $\frac{\textit{Reflexivity:}}{\text{If } \bar{A} \in \bar{\Gamma}, \text{ then } \bar{\Gamma} \vdash_{\text{N2Int}}^{s} \bar{A}.$

 $\begin{array}{l} \hline \textit{Monotonicity:} \\ \text{If } \bar{\Gamma} \vdash^{s}_{\text{N2Int}} \bar{A} \text{ and } \bar{\Gamma} \subseteq \bar{\Delta} \text{ then } \bar{\Delta} \vdash^{s}_{\text{N2Int}} \bar{A}. \end{array}$

Transitivity:

If $\overline{\Gamma} \vdash_{\mathsf{N2Int}}^{s} \overline{B}$ for all $\overline{B} \in \overline{\Delta}$ and $\overline{\Delta} \vdash_{\mathsf{N2Int}}^{s} \overline{A}$ then $\overline{\Gamma} \vdash_{\mathsf{N2Int}}^{s} \overline{A}$.

Compactness:

If $\overline{\Gamma} \vdash_{\text{N2Int}}^{s} \overline{A}$ then $\overline{\Delta} \vdash_{\text{N2Int}}^{s} \overline{A}$ for some finite $\overline{\Delta} \subseteq \overline{\Gamma}$.

Structurality:

If $\overline{\Gamma} \vdash_{\text{N2Int}}^{s} \overline{A}$ then $\{s(\overline{B}) \mid \overline{B} \in \overline{\Gamma}\} \vdash_{\text{N2Int}}^{s} s(\overline{A})$ for any substitution *s*.

Here, $s(A^{\delta}) := (s(A))^{\delta}$.

Replacement theorems

<ロト < 団 > < 臣 > < 臣 > < 臣 > < 臣 > < 臣 > < 臣 < つ < ぐ</p>

Signed equivalences and subformulas

Equivalence of signed formulas

$$\bar{A} \equiv \bar{B} \iff \bar{A} \vdash_{\text{N2Int}}^{s} \bar{B} \text{ and } \bar{B} \vdash_{\text{N2Int}}^{s} \bar{A}$$

Define $\overline{B} \leq \overline{A}$ — " \overline{B} is an occurrence of a signed subformula in \overline{A} ": i) $\overline{A} \leq \overline{A}$; ii) if $(B \circ C)^{\delta} \leq \overline{A}$, then $B^{\delta}, C^{\delta} \leq \overline{A} \quad \circ \in \{\land, \lor\}, \delta \in \{+, -\}$; iii) if $(B \rightarrow C)^+ \leq \overline{A}$, then $B^+, C^+ \leq \overline{A}$; iv) if $(B \rightarrow C)^- \leq \overline{A}$, then $B^+, C^- \leq \overline{A}$; v) if $(B \sim C)^+ \leq \overline{A}$, then $B^+, C^- \leq \overline{A}$; v) if $(B \sim C)^- \leq \overline{A}$, then $B^-, C^- \leq \overline{A}$.

うしつ 山 マイボットボット モーシック

Signed replacement

Theorem.

Suppose $\epsilon \in \{+, -\}$ and $p^{\epsilon} \leq \overline{A}$, then if B^{ϵ} and C^{ϵ} are equivalent, then so are $\overline{A}(B^{\epsilon})$ and $\overline{A}(C^{\epsilon})$:

$$rac{B^\epsilon \equiv C^\epsilon}{ar{A}(B^\epsilon) \equiv ar{A}(C^\epsilon)}$$

 $\overline{A}(B)$ is the result of replacing corresponding *p* with *B*. $\overline{A}(C)$ is the result of replacing corresponding *p* with *C*.

Intuition: we can replace signed formulas by equivalent signed formulas as long as we respect the attitudes (signs).

Remark: weak replacement, positive replacement and their duals all follow from signed replacement.

A Hilbert-style calculus that takes rejection seriously

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Natural deduction for 2Int consists of

- natural deduction rules for intuitionistic logic (assertion);
- their duals (rejection);
- ► interplay rules.

Q. Can we replace first two with Hilbert-style calculi for intuitionistic and dual intuitionistic logic to get Hilbert-style calculus for both assertion and rejection?

▲□▶ ▲□▶ ▲豆▶ ▲豆▶ □豆 = のへで

A. Kind of.

Signed Hilbert-style calculus H2Int

Initial axioms of H2Int:

- intuitionistic axioms with plus sign;
- duals of intuitionistic axioms with minus sign.

Modus ponens and its dual:

$${A^+ \ (A o B)^+ \over B^+} \,, \qquad {(B \,{<\!\!\!\!<}\, A)^- \ A^- \over B^-} \,.$$

Interplay rules:

$$\begin{array}{c} \underline{A^{+} \quad B^{-}} \\ (A \prec B)^{+} \end{array}, \qquad \underline{(A \prec B)^{+}} \\ \underline{A^{+} \quad B^{-}} \\ (A \rightarrow B)^{-} \end{array}, \qquad \underline{(A \rightarrow B)^{-}} \\ A^{+} \end{array}.$$

くして 山田 (山田) (山) (山)

Signed Hilbert-style calculus H2Int

Additional axioms of H2Int:

$$\begin{array}{ll} (A \prec B) \leftrightarrow (A \wedge \neg B)^+, & (A \rightarrow B) \succ (B \vee \neg A)^-, \\ \neg (A \rightarrow B) \leftrightarrow (A \wedge \neg B)^+, & \neg (A \prec B) \succ (B \vee \neg A)^-, \\ \neg (A \prec B) \rightarrow (\neg B \rightarrow \neg A)^+, & (\neg A \prec \neg B) \prec \neg (B \rightarrow A)^-. \end{array}$$

A kind of signed canonical models method gives us

Theorem.

$$\overline{\Gamma} \vdash^{s}_{\mathsf{H2Int}} \overline{A} \iff \overline{\Gamma} \vDash^{s}_{\mathsf{2Int}} \overline{A}.$$

,

General framework

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Signed consequence relations

A signed consequence relation is a relation

 $\vdash^{s} \subseteq P(\operatorname{For}^{s}\mathcal{L}) \times \operatorname{For}^{s}\mathcal{L}$

where For ${}^{s}\mathcal{L}$ are all signed \mathcal{L} -formulas, satisfying *Reflexivity:* if $\overline{A} \in \overline{\Gamma}$, then $\overline{\Gamma} \vdash {}^{s}\overline{A}$. *Monotonicity:* if $\overline{\Gamma} \vdash {}^{s}\overline{A}$ and $\overline{\Gamma} \subseteq \overline{\Delta}$ then $\overline{\Delta} \vdash {}^{s}\overline{A}$. *Transitivity:* if $\overline{\Gamma} \vdash {}^{s}\overline{B}$ for all $\overline{B} \in \overline{\Delta}$ and $\overline{\Delta} \vdash {}^{s}\overline{A}$ then $\overline{\Gamma} \vdash {}^{s}\overline{A}$.

It is *compact*, if $\overline{\Gamma} \vdash^{s} \overline{A}$ then $\overline{\Delta} \vdash^{s} \overline{A}$ for some finite $\overline{\Delta} \subseteq \overline{\Gamma}$; and *structural*, if $\overline{\Gamma} \vdash^{s} \overline{A}$ implies $s(\overline{\Gamma}) \vdash^{s} s(\overline{A})$ for any substitution s.

Wansing's approach

Wansing develops two-consequence relations approach to taking rejection seriously, which

leads us to understanding a logic not as a pair (\mathcal{L}, \vdash) consisting of a language and a consequence relation, but as a triple $(\mathcal{L}, \vdash, \vdash^d)$ consisting of a language, a consequence relation, and a dual consequence relation [...]

where \vdash corresponds to assertion and \vdash^d to rejection.

H. Wansing (2017) A more general general proof theory.

Signed consequences generalize this approach since

 $\Gamma \vdash A : \iff \Gamma^+ \vdash^s A^+; \qquad \Gamma \vdash^d A : \iff \Gamma^- \vdash^s A^-.$

Bochman's biconsequences

Biconsequences are relations $\vdash^{b} \subseteq (For \mathcal{L})^{4}$, satisfying some properties, where

 $\Gamma_1:\Gamma_2\vdash^b\Delta_1:\Delta_2$

holds "if all propositions from Γ_1 are true and all proposition from Γ_2 are false, then either one of the proposition from Δ_1 is true or one of the propositions from Δ_2 is false".

A. Bochman (1998) Biconsequence relations.

Since we know how to encode a pair of sets of formulas into a set of signed formulas, biconsequences are to signed consequence what Scott consequence relations are to Tarskian consequence relations.

Unilateral components

With any signed consequence \vdash^{s} we associate its

positive component \vdash^+ :

$$\Gamma \vdash^+ A : \iff \Gamma^+ \vdash^s A^+;$$

negative component \vdash^- :

$$\Gamma \vdash^{-} A : \iff \Gamma^{-} \vdash^{s} A^{-}.$$

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Both components are Tarskian consequence relations.

Nelson's logic bilaterally

Axiomatics

N4 is the positive fragment of intuitionistic logic +

$$\sim (A \wedge B) \leftrightarrow A \vee B; \qquad \sim A \leftrightarrow A;$$

 $\sim (A \vee B) \leftrightarrow A \wedge B; \qquad \sim (A \to B) \leftrightarrow A \wedge B;$

Unilateraly its positive fragment coincides with the positive fragment of intuitionsitic logic.

One can think of \sim as internalizing rejection:

$$(\sim A)^+ \equiv A^-$$
 and $(\sim A)^- \equiv A^+$.

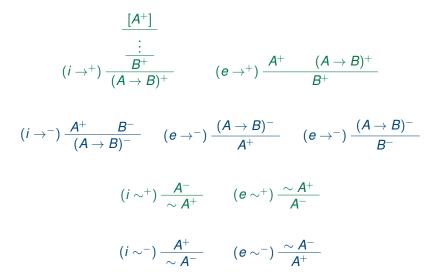

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Positive fragment of Nelson's logic

Denote this system by N4^s. Then we can naturally define \vdash_{N4}^{s} .

The positive component of \vdash_{N4}^{s} is the usual consequence of N4.

Let PN4^s be N4^s minus rules for \sim (a bilateral positive fragment).

Then, e.g.,

$$A^+, B^- \vdash^{s}_{\mathsf{PN4}} (A \to B)^+.$$

< ロ > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Bilaterally, positive fragment of N4 still has meaningful rejection.

Compositionality and definitional equivalence

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Compositionality

Q. For an n-ary connective f what does assertion A(f(p₁,...,p_n)) and rejection R(f(p₁,...,p_n)) depend upon?

General compositionality: on all of the

 $\mathcal{A}(p_1), \ \mathcal{R}(p_1), \ \ldots, \ \mathcal{A}(p_n), \ \mathcal{R}(p_n).$

Polarized compositionality: for each p_i chose one of

 $\mathcal{A}(p_i)$ or $\mathcal{R}(p_i)$.

according to a *polarity* function.

Polarity

```
For instance, in N4

\mathcal{A}(A \rightarrow B) depends on \mathcal{A}(A) and \mathcal{A}(B);

\mathcal{R}(A \rightarrow B) depends on \mathcal{R}(A) and \mathcal{A}(B).
```

Polarity α maps n-ary connective *f* and a sign $\delta \in \{+, -\}$ into

$$\alpha(f,\delta) = \langle \alpha(f,\delta,1), \ldots, \alpha(f,\delta,n) \rangle,$$

where $\alpha(f, \delta, i) \in \{+, -\}$.

Intuitively, say,

$$\alpha(f,+,1) = -$$

means that to assert $f(p_1, \ldots, p_n)$ we need to know how to reject p_1 .

Polarity for N4

Polarity can be naturally defined for all systems with strong negation and for 2Int.

For instance, for N4 one can put:

$$\begin{array}{ll} \alpha(\wedge,+) &:= \langle +,+\rangle; & \alpha(\wedge,-) &:= \langle -,-\rangle; \\ \alpha(\vee,+) &:= \langle +,+\rangle; & \alpha(\vee,-) &:= \langle -,-\rangle; \\ \alpha(\rightarrow,+) &:= \langle +,+\rangle; & \alpha(\rightarrow,-) &:= \langle +,-\rangle; \\ \alpha(\sim,+) &:= \langle -\rangle; & \alpha(\sim,-) &:= \langle +\rangle. \end{array}$$

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

On the way to definitional equivalence

Let us fix two language-polarity-signed consequence triples:

$$\langle \mathcal{L}_1, \alpha_1, \vdash_1^s \rangle, \qquad \langle \mathcal{L}_2, \alpha_2, \vdash_2^s \rangle$$

A general base $(\mathcal{L}_1, \mathcal{L}_2)$ -translation θ maps any n-ary connective $f \in \mathcal{L}_1$ and a sign $\delta \in \{+, -\}$ to a \mathcal{L}_2 -formula

 $\theta^{\delta}(f)(p_1,\ldots,p_{2n}).$

A *polarized base* $(\mathcal{L}_1, \mathcal{L}_2)$ *-translation* θ maps any n-ary connective $f \in \mathcal{L}_1$ and a sign $\delta \in \{+, -\}$ to a \mathcal{L}_2 -formula

 $\theta^{\delta}(f)(p_1,\ldots,p_n).$

< ロ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

General structural translations

Let θ be a general base $(\mathcal{L}_1, \mathcal{L}_2)$ -translation. let

For a sign $\delta \in \{+, -\}$ and an \mathcal{L}_1 formula A define a \mathcal{L}_2 -formula $\Theta^{\delta}(A)$:

•
$$\Theta^{\delta}(p) := p$$
 and

$$\blacktriangleright \Theta^{\delta}(f(A_1,\ldots,A_n)) :=$$

$$\theta^{\delta}(f)(\Theta^+(A_1), \Theta^-(A_1), \ldots, \Theta^+(A_n), \Theta^-(A_n)).$$

Finally, $\Theta^{s}(A^{\delta}) := (\Theta^{\delta}(A))^{\delta}$. Then

$$\Theta^s$$
: For ${}^s\mathcal{L}_1 \to \text{For }{}^s\mathcal{L}_2$

is a general (structural signed) $(\mathcal{L}_1, \mathcal{L}_2)$ -translation.

Polarized structural translations

Let θ be a polarized base ($\mathcal{L}_1, \mathcal{L}_2$)-translation. let

For a sign $\delta \in \{+, -\}$ and an \mathcal{L}_1 formula A define a \mathcal{L}_2 -formula $\Theta^{\delta}(A)$:

•
$$\Theta^{\delta}(p) := p$$
 and

$$\blacktriangleright \Theta^{\delta}(f(A_1,\ldots,A_n)) :=$$

$$\theta^{\delta}(f)(\Theta^{\alpha_1(f,\delta,1)}(A_1),\ldots,\Theta^{\alpha_1(f,\delta,n)}(A_n)).$$

Finally, $\Theta^{s}(A^{\delta}) := (\Theta^{\delta}(A))^{\delta}$. Then

$$\Theta^s$$
: For ${}^s\mathcal{L}_1 \to \text{For }{}^s\mathcal{L}_2$

is a polarized (structural signed) $(\mathcal{L}_1, \mathcal{L}_2)$ -translation.

Definitional equivalence

Signed consequences \vdash_1^s and \vdash_2^s are *definitionally equivivalent w.r.t.* general/polarized translations, if

- there is a general/polarized $(\mathcal{L}_1, \mathcal{L}_2)$ -translation Θ^s ;
- there is a general/polarized $(\mathcal{L}_2, \mathcal{L}_1)$ -translation Λ^s ;

$$\blacktriangleright \ \bar{\Gamma} \vdash_1^s \bar{A} \iff \Theta^s(\bar{\Gamma}) \vdash_2^s \Theta^s(\bar{A});$$

$$\blacktriangleright \ \bar{\Delta} \vdash_2^s \bar{B} \iff \Lambda^s(\bar{\Delta}) \vdash_1^s \Lambda^s(\bar{B});$$

$$\blacktriangleright \bar{A} + _1^s \Lambda^s \Theta^s(\bar{A});$$

 $\blacktriangleright \ \bar{B} \twoheadrightarrow_2^s \Theta^s \Lambda^s(\bar{B}).$

Slightly informal facts

Fact 1: both notions generalize usual definitional equivalence.

Fact 2: general is more general than polarized.

Fact 3: both come with their own problems.

One example

Bilattice connective \otimes

 $A \otimes B \leftrightarrow A \wedge B$; $\sim (A \otimes B) \leftrightarrow \sim (A \vee B)$;

is definable in ({ \land , \lor }-fragment of) N4.

Polarity for \otimes :

$$\alpha(+,\otimes) = \langle +,+\rangle; \qquad \alpha(-,\otimes) = \langle -,-\rangle.$$

Then the polarized definition is:

$$\Theta^+(A \otimes B) := \Theta^+(A) \wedge \Theta^+(B);$$

 $\Theta^-(A \otimes B) := \Theta^-(A) \vee \Theta^-(B).$

Unilaterally, one can needs additional constants *neither* and *both* to define \otimes in N4.

N4 and 2Int are definitionally equivalent

Defining \prec in N4:

$$\Theta^+(A \prec B) := \Theta^+(A) \land \Theta^-(B);$$

 $\Theta^-(A \prec B) := \sim (\sim \Theta^-(B) \to \sim \Theta^-(A)).$

Defining \sim in 2Int:

$$\Lambda^+(\sim A) := \top \prec \Lambda^-(A);$$

 $\Lambda^-(\sim A) := \Lambda^+(A) \rightarrow \bot.$

・ロト・日本・日本・日本・日本・日本

Polarized problems

In practice, polarized definition covers most natural cases.

But, what if there is a connective $f(p_1, ..., p_n)$ such that, say,

 $\mathcal{A}(f(p_1,\ldots,p_n))$

depends both on $\mathcal{A}(p_1)$ and on $\mathcal{R}(p_1)$?

Strong implication $A \Rightarrow B := (A \rightarrow B) \land (\sim B \rightarrow \sim A)$ is such a connective.

Strong implication can be defined

- ► unilaterally;
- bilaterally wrt general definitions;
- but not bilaterally wrt polarized definitions.

Trivial definitions

Suppose we want to keep a connective in place by giving it a trivial definition.

In the *polarized* setting that is easy:

$$\Theta^{\delta}(f(A_1,\ldots,A_n)=f(\Theta^{\alpha(\delta,f,1)}(A_1),\ldots,\Theta^{\alpha(\delta,f,n)}(A_n)).$$

But in the *general* setting it is entirely unclear.

The definition of an n-ary connective is a formula of 2n variables. So, for instance,

$$egin{aligned} & heta^+(o)(p_1,p_2,p_3,p_4)=p_1 o p_2; \ & heta^-(o)(p_1,p_2,p_3,p_4)=p_1 o p_4. \end{aligned}$$

Defining strong negation

Clearly, in polarized setting one can define strong negation \sim s.t.

$$\sim A^+ + sA^-; \sim A^- + sA^+.$$

As long as we have formulas *B* and *C* s.t.

$$B(A)^+ + A^-; \qquad C(A)^- + A^+.$$

Moreover, under some (semantically phrased) conditions concerning compositionality signed consequences can be *conservatively* expanded by the strong negation.

Thank you!
